Maximum Match 100%  
Listing first 23 summaries

Database : estdb:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/notes="Vector: PWD42nv; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adapted DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adapted mouse DNA was annealed to adapted vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

**JOURNAL COMMENT** PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbsgap.versaillies.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (<http://www.genoplante.com>) and <http://genoplante-info.infobiogen.fr>.

XX Screening assay for modulators of gene expression - relating to

PT cardiovascular diseases.

XX Example C3; Col 69-70; 93pp; English.

CC TS8419-61 are probes used in molecular cloning of cardiovascular gene  
 CC promoters and regulatory elements for insertion into a mammalian  
 CC expression shuttle vector. Mammalian expression shuttle vectors were  
 CC designed to allow the construction of promoter-reporter gene fusions to  
 CC be used in high-throughput screens to identify transcriptionally  
 CC modifying chemicals. The vectors can be used in a claimed screening assay  
 CC for modulators of gene expression relating to cardiovascular diseases.  
 CC e.g. atherosclerosis, restenosis, thrombosis or hypertension. TS8425-27  
 CC are probes used to screen a human leukocyte genomic DNA library in EMBL-3  
 CC for the Apolipoprotein B gene promoter. (Updated on 25-MAR-2003 to  
 CC correct pP field.)

 PT Closed substrate platform has slide element comprising microfluidic  
 PT analysis platform, enclosed within container having inlet port for  
 PT introducing liquid into sample analysis area and vent for removing air  
 PT from container.

XX Example; Page 70; 49pp; English.  
 XX The invention relates to a closed substrate platform which has a slide  
 CC element comprising microfluidic analysis platform, enclosed within  
 CC container having inlet port for introducing liquid into sample analysis  
 CC area and vent for removing air from container. The invention is used for  
 CC identifying a nucleic acid sequence capable of binding to a biomolecule  
 CC such as a nucleic acid sequence or polypeptide. It is useful for  
 CC identifying a polypeptide capable of binding to a biomolecule such as a  
 CC nucleic acid sequence, polypeptide, multimeric polypeptide, an antibody,  
 CC a receptor, a hormone, drug or drug candidate. It is also useful for  
 CC sample analysis, especially liquid, and is useful for detecting DNA  
 CC sequence variation, DNA sequencing, deletion analysis, single nucleotide  
 CC polymorphism (SNP) analysis, gene expression, genotyping, etc. The  
 CC present sequence is ApoB71 gene fragment containing SNP. This sequence is  
 CC used in the exemplification of the invention

 PT New antisense oligonucleotides for modulating apolipoprotein B,  
 PT especially for preventing or treating atherosclerosis, hyperlipidemia or  
 PT diabetes, or for modulating glucose, cholesterol, lipoprotein or  
 PT triglyceride levels.  
 XX  
 PS Example 13; Page 93; 160pp; English.  
 XX The invention relates to a novel compound that is 8-50 nucleotides in  
 CC length that is targeted to a nucleic acid molecule encoding  
 CC apolipoprotein B (ApoB), and specifically hybridises with and inhibits

CC the expression of a nucleic acid molecule encoding ApoB; or which  
 CC specifically hybridises with at least an 8-nucleotide portion of an  
 CC active site on a nucleic acid molecule encoding ApoB. A compound of the  
 CC invention has antilipaeamic, antiarteriosclerotic, antidiabetic,  
 CC anorectic, and cardiovascular activity. The compound may have a use in  
 CC gene therapy. The antisense oligonucleotide is useful for treating an  
 CC animal having a disease or conditions associated with ApoB, e.g. a  
 CC condition involving abnormal lipid metabolism, a condition involving  
 CC abnormal cholesterol metabolism, atherosclerosis, or a condition  
 CC involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes  
 CC (specifically Type 2 diabetes), obesity, atherosclerosis or  
 CC cardiovascular disease). The new compound or the antisense  
 CC oligonucleotide is also useful for modulating glucose levels  
 CC (particularly plasma or serum glucose levels) in a human or diabetic  
 CC animal, or for modulating serum cholesterol levels, lipoprotein levels  
 CC (specifically VLDL, HDL or LDL) or serum triglyceride levels,  
 CC particularly in a human. The antisense compound is also useful for  
 CC preventing or delaying the onset of a disease or condition associated  
 CC with ApoB, or the onset of an increase in glucose levels in the animal or  
 CC human. The present sequence is used in the exemplification of the  
 CC invention

 PT Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidaemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.

PS Example 13; SEQ ID NO 6; 483pp; English.  
 XX  
 CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,

CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of  
 CC the FAM/AMRA-labelled probe of the invention which was used to analyse  
 CC human apolipoprotein B (ApoB) DNA.

 PT New isolated oligonucleotide regulatory sequences that control the  
 PT expression of the apolipoprotein A-I gene - useful for identifying and  
 PT characterising regulatory sequences and transcription factors involved in  
 PT apolipoprotein A-I expression, and for the treatment of disorders  
 PT associated with lipid metabolism such as atherosclerosis.

XX  
 PS Example 3; Col 53-54; 73pp; English.

XX  
 CC The invention relates to isolated apolipoprotein A-I (apoA-I) gene  
 CC regulatory sequence elements, designated (A), (B), (C) and (D). Elements  
 CC (A)-(D) consist of nucleotides 212-250, 106-157, 59-86 and 14-44,  
 CC respectively, of the sequence AAX21700, which corresponds to nucleotides  
 CC -233 to +32 of the apoA-I gene. The apoA-I sequences may be used to  
 CC identify and characterize the regulatory sequences and protein  
 CC transcription factors involved in the expression of the apoA-I gene. This  
 CC information will provide methods for altering the expression of that

CC gene, for use in applications to detect and treat disorders related to  
 CC lipid metabolism (e.g. atherosclerosis). Sequences AAX21755 to AAX21758  
 CC represent apoB promoter oligonucleotides

XX
XX New antisense oligonucleotides for modulating apolipoprotein B,
XX especially for preventing or treating atherosclerosis, hyperlipidaemia or
XX diabetes, or for modulating glucose, cholesterol, lipoprotein or
XX triglyceride levels.
XX
XX Example 13; Page 93; 160pp; English.
XX
XX The invention relates to a novel compound that is 8-50 nucleotides in
XX length that is targeted to a nucleic acid molecule encoding
XX apolipoprotein B (ApoB), and specifically hybridises with and inhibits
XX the expression of a nucleic acid molecule encoding ApoB; or which
XX specifically hybridises with at least an 8-nucleotide portion of an
XX active site on a nucleic acid molecule encoding ApoB. A compound of the
XX invention has antilipaemic, antiarteriosclerotic, antidiabetic,
XX anorectic, and cardiovascular activity. The compound may have a use in
XX gene therapy. The antisense oligonucleotide is useful for treating an
XX animal having a disease or conditions associated with ApoB, e.g. a
XX condition involving abnormal lipid metabolism, a condition involving
XX abnormal cholesterol metabolism, atherosclerosis, or a condition
XX involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes
XX (specifically Type 2 diabetes), obesity, atherosclerosis or
XX cardiovascular disease). The new compound or the antisense
XX oligonucleotide is also useful for modulating glucose levels
XX (particularly plasma or serum glucose levels) in a human or diabetic
XX animal, or for modulating serum cholesterol levels, lipoprotein levels
XX (specifically VLDL, HDL or LDL) or serum triglyceride levels,
XX particularly in a human. The antisense compound is also useful for
XX preventing or delaying the onset of a disease or condition associated
XX with ApoB, or the onset of an increase in glucose levels in the animal or
XX human. The present sequence is used in the exemplification of the
XX invention

XX Diagnosing, or determining a predisposition to developing, an arterial
PT wall disruptive disorder by correlation with the incidence of age related
PT macular degeneration (AMD), e.g. by detecting genotypic or phenotypic
PT marker(s) for AMD.
XX Example 6; Page 98b; 148pp; English.
XX The present sequence is one of a number of primers used to identify
CC molecules synthesised by the retina, retinal pigmented epithelium and/or
CC choroid of the eyes of humans with age-related macular degeneration
CC (AMD). This RT-PCR procedure was performed as an example of a method for
CC diagnosing, or determining a predisposition to developing, an arterial
CC wall disruptive disorder (AWDD) by correlation with the incidence of age
CC related macular degeneration. Arterial wall disruptive disorders include
CC aneurysms such as an abdominal aortic aneurysm (AAA), a thoracic aortic
CC aneurysm (TAA), a peripheral aneurysm, a visceral aneurysm, or an
CC intracranial aneurysm. Macular degeneration therapeutics, e.g.
CC antagonists of TNF-alpha, IL-1, GM-CSF, IL-4 or IL-13, are useful for
CC treating or preventing the development of AWDD in humans

XX (HAGE/) HAGEMAN G S.
XX Hageman GS;
XX WPI; 2003-897617/82.
XX Diagnosis of an arterial wall disruptive disorder e.g. an abdominal
PT aortic aneurysm useful e.g. for early or presymptomatic detection uses
PT detection of genotypic or phenotypic markers for macular degeneration in
PT the eye.
XX Example 6; Page 43; 64pp; English.
XX The present invention relates to a method for diagnosing an arterial wall
CC disruptive disorder, or a predisposition to developing such a disorder.
CC The method uses a novel correlation between the disorder and macular
CC degeneration in the eye i.e. the incidence of age-related macular
CC degeneration (AMD). The method comprises detecting one or more genotypic
CC or phenotypic markers for macular degeneration in the eye, indicative of
CC the existence of/predisposition towards an arterial wall disruptive
CC disorder. The method is useful to diagnose, or indicate a predisposition
CC towards, an arterial wall disruptive disorder, e.g. an aortic,
CC peripheral, visceral or intracranial aneurysm (preferably a dissecting
CC aortic aneurysm), and especially an abdominal aortic aneurysm (AAA) or thoracic
CC aneurysm (TAA). Kits are also included. Identification of
CC aneurysms at an early (or presymptomatic) stage enables surgery whilst
CC the aneurysm size is small, reducing the risk of sudden rupture and death
CC (which increases with aneurysm size). It may also reduce the amount of
CC surgery required, since large aneurysms may affect other branching
CC vessels around them, and enables removal of inflammatory aneurysms before
CC the inflammation affects adjacent structures. The method is also useful
CC for non-invasive monitoring e.g. of individuals identified as at risk of
CC developing an aneurysm or to monitor effectiveness of a therapy for an
CC existing aneurysm. The present sequence represents a reverse
CC transcriptase (RT)-PCR primer used in the examples of the present
CC invention.

CC The invention relates to isolated apolipoprotein A-I (apoA-I) gene  
 CC regulatory sequence elements, designated (A), (B), (C) and (D). Elements  
 CC (A)-(D) consist of nucleotides 212-250, 106-157, 59-86 and 14-44,  
 CC respectively, of the sequence AAX21700, which corresponds to nucleotides  
 CC -233 to +32 of the apoA-I gene. The apoA-I sequences may be used to  
 CC identify and characterize the regulatory sequences and protein  
 CC transcription factors involved in the expression of the apoA-I gene. This  
 CC information will provide methods for altering the expression of that  
 CC gene, for use in applications to detect and treat disorders related to  
 CC lipid metabolism (e.g. atherosclerosis)

XX Diagnosing macular degeneration (MD), especially age-related macular  
 PT degeneration (AMD), exudative or neovascular forms, by detecting a marker  
 PT for arterial wall disruptive disorder, particularly abdominal aortic  
 PT aneurysm.

XX Example 6; Page 97B; 142pp; English.

XX The present invention describes a method (M1) for the diagnosis of  
 CC macular degeneration (MD), or detecting predisposition for developing MD.  
 CC The method comprises detecting one or more markers (I) of an arterial  
 CC wall disruptive disorder (AWDD). Also described are: (1) a kit for  
 CC diagnosing MD comprising sequence specific primers for a region  
 CC containing a polymorphism indicative of AWDD, reagents for amplification  
 CC and for analysis of amplified nucleic acid; (2) diagnosing (M2) MD  
 CC comprising an immunoassay that uses an antibody specific for a gene  
 CC product indicative of AWDD; (3) kit for (M2); (4) treatment or prevention  
 CC of MD or AMD by administering an agent (II), especially an  
 CC antiinflammatory agent, effective against AWDD; (5) pharmaceutical  
 CC composition for method (4); (6) identifying (II); and (7) an animal  
 CC model (III) for MD. The method can diagnose age-related MD or the  
 CC exudative or neovascular form of MD, characterised by disciform scars  
 CC and/or choroidal neovascularisation, or a precursor phenotype. Also  
 CC agents (II), particularly anti-inflammatories, that are effective against  
 CC AWDD are used to treat or prevent MD. The present sequence represents a  
 CC PCR primer for apolipoprotein B (Apo B), which is used in an example from  
 CC the present invention

PT Diagnosing macular degeneration (MD), especially age-related macular  
PT degeneration (AMD), exudative or neovascular forms, by detecting a marker  
PT for arterial wall disruptive disorder, particularly abdominal aortic  
PT aneurysm.  
XX  
PS Example 6; Page 97B; 142pp; English.  
XX  
CC The present invention describes a method (M1) for the diagnosis of  
CC macular degeneration (MD), or detecting predisposition for developing MD.  
CC The method comprises detecting one or more markers (I) of an arterial  
CC wall disruptive disorder (AWDD). Also described are: (1) a kit for  
CC diagnosing MD comprising sequence specific primers for a region  
CC containing a polymorphism indicative of AWDD, reagents for amplification  
CC and for analysis of amplified nucleic acid; (2) diagnosing (M2) MD  
CC comprising an immunoassay that uses an antibody specific for a gene  
CC product indicative of AWDD; (3) kit for (M2); (4) treatment or prevention  
CC of MD or AMD by administering an agent (II), especially an  
CC anti-inflammatory agent, effective against AWDD; (5) pharmaceutical  
CC composition for method (4); (6) identifying (II); and (7) an animal  
CC model (III) for MD. The method can diagnose age-related MD or the  
CC exudative or neovascular form of MD, characterised by disciform scars  
CC and/or choroidal neovascularisation, or a precursor phenotype. Also  
CC agents (III), particularly anti-inflammatories, that are effective against  
CC AWDD are used to treat or prevent MD. The present sequence represents a  
CC PCR primer for apolipoprotein B (Apo B), which is used in an example from  
CC the present invention

PT Diagnosing, or determining a predisposition to developing, an arterial  
PT wall disruptive disorder by correlation with the incidence of age related  
PT macular degeneration (AMD), e.g. by detecting genotypic or phenotypic  
PT marker(s) for AMD.  
XX  
PS Example 6; Page 98b; 148pp; English.  
XX  
CC The present sequence is one of a number of primers used to identify  
CC molecules synthesised by the retina, retinal pigmented epithelium and/or  
CC choroid of the eyes of humans with age-related macular degeneration  
CC (AMD). This RT-PCR procedure was performed as an example of a method for  
CC diagnosing, or determining a predisposition to developing, an arterial  
CC wall disruptive disorder (AWDD) by correlation with the incidence of age  
CC related macular degeneration. Arterial wall disruptive disorders include  
CC aneurysms such as an abdominal aortic aneurysm (AAA), a thoracic aortic  
CC aneurysm (TAA), a peripheral aneurysm, a visceral aneurysm, or an  
CC intracranial aneurysm. Macular degeneration therapeutics, e.g.  
CC antagonists of TNF-alpha, IL-1, GM-CSF, IL-4 or IL-13, are useful for  
CC treating or preventing the development of AMD in humans

XX
XX  Determining genetic risk of arteriosclerosis, for clinical diagnosis,
XX  comprises hybridizing patient nucleic acid with an array of probes
XX  derived from risk-associated reference genes and their mutations.
XX
XX  Example 1; Page 119; 146pp; German.
XX
XX  This invention describes a novel method for determining the genetic risk
XX  of arteriosclerosis both for clinical diagnosis and for population
XX  studies. The method comprises: (i) selecting risk-associated reference
XX  nucleic acid sequences, including their functionally characterizing
XX  mutations; (ii) applying probes from these sequences, or their
XX  complements, to a carrier; (iii) hybridising the probes with a nucleic
XX  acid from (or synthesised from) a patient sample; and (iv) detecting and
XX  evaluating the hybridisation pattern. The method provides a quick,
XX  inexpensive and informative diagnosis, and makes possible a
XX  multifactorial analysis for detecting e.g. synergism between different
XX  mutations or mutations that when present alone carry no risk but are risk
XX  -associated in presence of other mutations. The results may be combined
XX  with known risk-assessment methods to provide a more reliable diagnosis,
XX  especially important with new therapeutic methods (e.g. gene therapy)
XX  that are directed against specific genes. All relevant mutations in a
XX  reference sequence can be screened for in a single test and the method is
XX  well suited to automation. ABX09147-ABX09676 represent probes used to
XX  illustrate the method of the invention

XX
XX  Diagnosis of an arterial wall disruptive disorder e.g. an abdominal
XX  aortic aneurysm useful e.g. for early or presymptomatic detection in
XX  detection of genotypic or phenotypic markers for macular degeneration in
XX  the eye.
XX
XX  Example 6; Page 43; 64pp; English.
XX
XX  The present invention relates to a method for diagnosing an arterial wall
XX  disruptive disorder, or a predisposition to developing such a disorder.
XX  The method uses a novel correlation between the disorder and macular
XX  degeneration in the eye i.e. the incidence of age-related macular
XX  degeneration (AMD). The method comprises detecting one or more genotypic
XX  or phenotypic markers for macular degeneration in the eye, indicative of
XX  the existence of/predisposition towards an arterial wall disruptive
XX  disorder. The method is useful to diagnose, or indicate a predisposition
XX  towards, an arterial wall disruptive disorder, e.g. an aortic,
XX  peripheral, visceral or intracranial aneurysm (preferably a dissecting
XX  aneurysm), and especially an abdominal aortic aneurysm (AAA) or thoracic
XX  aortic aneurysm (TAA). Kits are also included. Identification of
XX  aneurysms at an early (or presymptomatic) stage enables surgery whilst
XX  the aneurysm size is small, reducing the risk of sudden rupture and death
XX  (which increases with aneurysm size). It may also reduce the amount of
XX  surgery required, since large aneurysms may affect other branching
XX  vessels around them, and enables removal of inflammatory aneurysms before
XX  the inflammation affects adjacent structures. The method is also useful
XX  for non-invasive monitoring e.g. of individuals identified as at risk of
XX  developing an aneurysm or to monitor effectiveness of a therapy for an
XX  existing aneurysm. The present sequence represents a reverse
XX  transcriptase (RT)-PCR primer used in the examples of the present
XX  invention.

 DR New antisense oligonucleotides for modulating apolipoprotein B,  
 PT especially for preventing or treating atherosclerosis, hyperlipidemia or  
 PT diabetes, or for modulating glucose, cholesterol, lipoprotein or  
 PT triglyceride levels.  
 XX  
 XX Example 13; Page 93; 160pp; English.  
 PS  
 XX The invention relates to a novel compound that is 8-50 nucleotides in  
 CC length that is targeted to a nucleic acid molecule encoding  
 CC apolipoprotein B (ApoB), and specifically hybridises with and inhibits  
 CC the expression of a nucleic acid molecule encoding ApoB; or which  
 CC specifically hybridises with at least an 8-nucleotide portion of an  
 CC active site on a nucleic acid molecule encoding ApoB. A compound of the  
 CC invention has antilipaeamic, antiarteriosclerotic, antidiabetic,  
 CC anorectic, and cardiovascular activity. The compound may have a use in  
 CC gene therapy. The antisense oligonucleotide is useful for treating an  
 CC animal having a disease or conditions associated with ApoB, e.g. a  
 CC condition involving abnormal lipid metabolism, a condition involving  
 CC abnormal cholesterol metabolism, atherosclerosis, or a condition  
 CC involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes  
 CC (specifically Type 2 diabetes), obesity, atherosclerosis or  
 CC cardiovascular disease). The new compound or the antisense  
 CC oligonucleotide is also useful for modulating glucose levels  
 CC (particularly plasma or serum glucose levels) in a human or diabetic  
 CC animal, or for modulating serum cholesterol levels, lipoprotein levels  
 CC (specifically VLDL, HDL or LDL) or serum triglyceride levels,  
 CC particularly in a human. The antisense compound is also useful for  
 CC preventing or delaying the onset of a disease or condition associated  
 CC with ApoB, or the onset of an increase in glucose levels in the animal or  
 CC human. The present sequence is used in the exemplification of the  
 CC invention

XX The invention relates to a novel antisense compound targeted to a nucleic  
CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
CC hybridizes with and inhibits the expression of human apolipoprotein B.  
CC The compound of the invention demonstrates antiarteriosclerotic, anti-  
CC diant, antidiabetic and anorectic activities and may be useful for  
CC preparing a composition for treating abnormal lipid or cholesterol  
CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidemia or  
CC cardiovascular disease. Furthermore, the compound has gene therapy  
CC applications. The current sequence is that of the ApoB antisense  
CC inhibition-related PCR primer which was used in the exemplification of  
CC the invention.

XX Antisense oligonucleotide compound that inhibits expression of mRNA  
PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
PT syndrome.  
XX

PS Example 13; SEQ ID NO 4; 483pp; English.  
XX  
XX The invention relates to a novel antisense compound where the compound  
CC hybridizes to and inhibits expression of mRNA encoding human  
CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
CC compound of the invention demonstrates cardiovascular,  
CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,  
CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
CC be useful for inhibiting the expression of apolipoprotein B in cells or  
CC tissues in vivo in order to address a condition associated with abnormal  
CC lipid or cholesterol metabolism. The compound may be useful for  
CC decreasing circulating lipoprotein levels, triglyceride levels,  
CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
CC reactants and chylomicrons and thus may be utilised during treatment of  
CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
CC diabetes, obesity and atherosclerosis. The current sequence is that of  
CC the PCR primer 1 of the invention which was used to amplify human  
CC apolipoprotein B (ApoB) DNA.

 DR Chimeric oligonucleotide useful as primer in nucleic acid extension and  
 PT amplification reactions and as capture probe in single nucleotide  
 PT polymorphism assays, has non-modified and modified nucleic acid residues.  
 XX Example 1; Page 8; 12pp; English.

PS The invention relates to chimeric oligonucleotide containing modified and  
 CC non-modified nucleic acid residues which are useful as primer in nucleic  
 CC acid extension and amplification reactions and as capture probe in single  
 CC nucleotide polymorphism (SNP) assays. Multiple primers are used in  
 CC multiplex PCR. The invention is useful in diagnostic purposes, as probes  
 CC in the purification, isolation and detection of pathogenic organisms such  
 CC as virus, bacteria or fungi, as generic tools for purification,  
 CC isolation, amplification and detection of nucleic acids from groups of  
 CC related species such as for instance RNA from gram- positive or gram  
 CC negative bacteria, fungi, mammalian cells. It is also useful as an  
 CC aptamer in molecular diagnostic e.g. in RNA mediated catalytic processes,  
 CC in specific binding of antibiotics, drugs, amino acids, peptides,  
 CC structural proteins, protein receptors, saccharides, enzymes,  
 CC polysaccharides, biological cofactors, nucleic acids, or triphosphates or  
 CC in the separation of enantiomers from racemic mixtures by stereospecific  
 CC binding. It is also used in antisense therapy for treating diseases e.g.  
 CC viral infection. The present sequence is a PCR primer used for amplifying  
 CC Apo B71 DNA. This sequence is used in the exemplification of the  
 CC invention

 DR New antisense oligonucleotides for modulating apolipoprotein B,  
 PT especially for preventing or treating atherosclerosis, hyperlipidemia or  
 PT diabetes, or for modulating glucose, cholesterol, lipoprotein or  
 PT triglyceride levels.  
 XX Example 15; Page 96; 160pp; English.

PS The invention relates to a novel compound that is 8-50 nucleotides in  
 CC length that is targeted to a nucleic acid molecule encoding  
 CC apolipoprotein B (ApoB), and specifically hybridises with and inhibits  
 CC the expression of a nucleic acid molecule encoding ApoB; or which  
 CC specifically hybridises with at least an 8-nucleotide portion of an  
 CC active site on a nucleic acid molecule encoding ApoB. A compound of the  
 CC invention has antilipemic, antiarteriosclerotic, antidiabetic,  
 CC anorectic, and cardiovascular activity. The compound may have a use in  
 CC gene therapy. The antisense oligonucleotide is useful for treating an  
 CC animal having a disease or conditions associated with ApoB, e.g. a  
 CC condition involving abnormal lipid metabolism, a condition involving  
 CC abnormal cholesterol metabolism, atherosclerosis, or a condition  
 CC involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes  
 CC (specifically type 2 diabetes), obesity, atherosclerosis or  
 CC cardiovascular disease). The new compound or the antisense  
 CC oligonucleotide is also useful for modulating glucose levels  
 CC (particularly plasma or serum glucose levels) in a human or diabetic  
 CC animal, or for modulating serum cholesterol levels, lipoprotein levels  
 CC (specifically VLDL, HDL or LDL) or serum triglyceride levels,  
 CC particularly in a human. The antisense compound is also useful for  
 CC preventing or delaying the onset of a disease or condition associated  
 CC with ApoB, or the onset of an increase in glucose levels in the animal or  
 CC human. The present sequence is used in the exemplification of the  
 CC invention

 XX CC The invention relates to a novel compound that is 8-50 nucleotides in  
 CC length that is targeted to a nucleic acid molecule encoding  
 CC apolipoprotein B (ApoB), and specifically hybridises with and inhibits  
 CC the expression of a nucleic acid molecule encoding ApoB; or which

CC specifically hybridises with at least an 8-nucleotide portion of an  
 CC active site on a nucleic acid molecule encoding ApoB. A compound of the  
 CC invention has antilipemic, antiarteriosclerotic, antidiabetic,  
 CC anorectic, and cardiovascular activity. The compound may have a use in  
 CC gene therapy. The antisense oligonucleotide is useful for treating an  
 CC animal having a disease or conditions associated with ApoB, e.g. a  
 CC condition involving abnormal lipid metabolism, a condition involving  
 CC abnormal cholesterol metabolism, atherosclerosis, or a condition  
 CC involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes  
 CC (specifically Type 2 diabetes), obesity, atherosclerosis or  
 CC cardiovascular disease). The new compound or the antisense  
 CC oligonucleotide is also useful for modulating glucose levels  
 CC (particularly plasma or serum glucose levels) in a human or diabetic  
 CC animal, or for modulating serum cholesterol levels, lipoprotein levels  
 CC (specifically VLDL, HDL or LDL) or serum triglyceride levels,  
 CC particularly in a human. The antisense compound is also useful for  
 CC preventing or delaying the onset of a disease or condition associated  
 CC with ApoB, or the onset of an increase in glucose levels in the animal or  
 CC human. The present sequence is used in the exemplification of the  
 CC invention

XX PT New antisense oligonucleotides for modulating apolipoprotein B,
XX PT especially for preventing or treating atherosclerosis, hyperlipidemia or
XX PT diabetes, or for modulating glucose, cholesterol, lipoprotein or
XX PT triglyceride levels.
XX PS Example 15; Page 96; 160pp; English.
XX CC The invention relates to a novel compound that is 8-50 nucleotides in
XX CC length that is targeted to a nucleic acid molecule encoding
XX CC apolipoprotein B (ApoB), and specifically hybridizes with and inhibits
XX CC the expression of a nucleic acid molecule encoding ApoB; or which
XX CC specifically hybridizes with at least an 8-nucleotide portion of an
XX CC active site on a nucleic acid molecule encoding ApoB. A compound of the
XX CC invention has antilipemic, antiarteriosclerotic, antidiabetic,
XX CC anorectic, and cardiovascular activity. The compound may have a use in
XX CC gene therapy. The antisense oligonucleotide is useful for treating an
XX CC animal having a disease or conditions associated with ApoB, e.g. a
XX CC condition involving abnormal lipid metabolism, atherosclerosis, or
XX CC abnormal cholesterol metabolism, atherosclerosis, or a condition
XX CC involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes
XX CC (specifically Type 2 diabetes), obesity, atherosclerosis or
XX CC cardiovascular disease). The new compound or the antisense
XX CC oligonucleotide is also useful for modulating glucose levels
XX CC (particularly plasma or serum glucose levels) in a human or diabetic
XX CC animal, or for modulating serum cholesterol levels, lipoprotein levels
XX CC (specifically VLDL, HDL or LDL) or serum triglyceride levels,
XX CC particularly in a human. The antisense compound is also useful for
XX CC preventing or delaying the onset of a disease or condition associated
XX CC with ApoB, or the onset of an increase in glucose levels in the animal or
XX CC human. The present sequence is used in the exemplification of the
XX CC invention

 DR  
 XX New antisense oligonucleotides for modulating apolipoprotein B,  
 PT especially for preventing or treating atherosclerosis, hyperlipidemia or  
 PT diabetes, or for modulating glucose, cholesterol, lipoprotein or  
 PT triglyceride levels.  
 XX Example 15; Page 96; 160pp; English.

XX The invention relates to a novel compound that is 8-50 nucleotides in  
 XX length that is targeted to a nucleic acid molecule encoding  
 CC apolipoprotein B (ApoB), and specifically hybridises with and inhibits  
 CC the expression of a nucleic acid molecule encoding ApoB; or which  
 CC specifically hybridises with at least an 8-nucleotide portion of an  
 CC active site on a nucleic acid molecule encoding ApoB. A compound of the  
 CC invention has antilipaeic, antiarteriosclerotic, antidiabetic,  
 CC anorectic, and cardiovascular activity. The compound may have a use in  
 CC gene therapy. The antisense oligonucleotide is useful for treating an  
 CC animal having a disease or conditions associated with ApoB, e.g. a  
 CC condition involving abnormal lipid metabolism, a condition involving  
 CC abnormal cholesterol metabolism, atherosclerosis, or a condition  
 CC involving an abnormal metabolic condition (e.g. hyperlipidaemia, diabetes  
 CC (specifically Type 2 diabetes), obesity, atherosclerosis or  
 CC cardiovascular disease). The new compound or the antisense  
 CC oligonucleotide is also useful for modulating glucose levels  
 CC (particularly plasma or serum glucose levels) in a human or diabetic

CC (specifically Type 2 diabetes), obesity, atherosclerosis or  
 CC cardiovascular disease). The new compound or the antisense  
 CC oligonucleotide is also useful for modulating glucose levels  
 CC (particularly plasma or serum glucose levels) in a human or diabetic  
 CC animal, or for modulating serum cholesterol levels, lipoprotein levels  
 CC (specifically VLDL, HDL or LDL) or serum triglyceride levels,  
 CC particularly in a human. The antisense compound is also useful for  
 CC preventing or delaying the onset of a disease or condition associated  
 CC with ApoB, or the onset of an increase in glucose levels in the animal or  
 CC human. The present sequence is used in the exemplification of the  
 CC invention

XX New antisense compound, useful for preparing a composition for treating
PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type
PT 2, obesity, hyperlipidemia or cardiovascular disease.
XX
PS Example 15; SEQ ID NO 44; 405pp; English.
XX
CC The invention relates to a novel antisense compound targeted to a nucleic
CC acid molecule encoding human apolipoprotein B (ApoB) which specifically
CC hybridizes with and inhibits the expression of human apolipoprotein B.
CC The compound of the invention demonstrates antiarteriosclerotic,
CC cardiant, antidiabetic and anorectic activities and may be useful for
CC preparing a composition for treating abnormal lipid or cholesterol
CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or
CC cardiovascular disease. Furthermore, the compound has gene therapy
CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-
CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a
CC phosphorothioate backbone throughout and in which all cytidine residues
CC are 5-methylcytidines.

 PS  
 XX The invention relates to a novel antisense compound targeted to a nucleic  
 CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the human ApoB antisense  
 CC inhibition target DNA of the invention.

 XX  
 CC The invention relates to a novel antisense compound targeted to a nucleic  
 CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
 CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a  
 CC phosphorothioate backbone throughout and in which all cytidine residues  
 CC are 5-methylcytidines.

 XX  
 XX Claim 1; SEQ ID NO 248; 405pp; English.  
 XX The invention relates to a novel antisense compound targeted to a nucleic

CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
 CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a  
 CC phosphorothioate backbone throughout and in which all cytidine residues  
 CC are 5-methylcytidines.

XX abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type
XX 2, obesity, hyperlipidemia or cardiovascular disease.
XX
XX Claim 1; SEQ ID NO 514; 405pp; English.
XX
XX The invention relates to a novel antisense compound targeted to a nucleic
XX acid molecule encoding human apolipoprotein B (ApoB) which specifically
XX hybridises with and inhibits the expression of human apolipoprotein B.

```

CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
 CC MOE) capmer antisense oligo of the invention which has 2'-MOE 'wings', a  
 CC phosphorothioate backbone throughout and in which all cytidine residues  
 CC are 5-methylcytidines.

XX New antisense compound, useful for preparing a composition for treating  
 PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type  
 PT 2, obesity, hyperlipidemia or cardiovascular disease.

XX Claim 1; SEQ ID NO 194; 405pp; English.

XX The invention relates to a novel antisense compound targeted to a nucleic  
 CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
 CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a  
 CC phosphorothioate backbone throughout and in which all cytidine residues

CC are 5-methylcytidines.

CC The invention relates to a novel antisense compound targeted to a nucleic
XX acid molecule encoding human apolipoprotein B (ApoB) which specifically
XX hybridises with and inhibits the expression of human apolipoprotein B.
XX The compound of the invention demonstrates antiarteriosclerotic,
XX cardiant, antidiabetic and anorectic activities and may be useful for
XX preparing a composition for treating abnormal lipid or cholesterol
XX metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or
XX cardiovascular disease. Furthermore, the compound has gene therapy
XX applications. The current sequence is that of the 2'-O-methoxyethyl (2'-
XX MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a
XX phosphorothioate backbone throughout and in which all cytidine residues
XX are 5-methylcytidines.

 XX New antisense compound, useful for preparing a composition for treating  
 PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type  
 PT 2, obesity, hyperlipidaemia or cardiovascular disease.  
 XX Claim 1; SEQ ID NO 651; 405pp; English.  
 XX The invention relates to a novel antisense compound targeted to a nucleic  
 CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the human ApoB antisense  
 CC inhibition target DNA of the invention.

PT New antisense compound, useful for preparing a composition for treating  
 PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type  
 PT 2, obesity, hyperlipidaemia or cardiovascular disease.

PS Claim 1; SEQ ID NO 208; 405pp; English.

XX The invention relates to a novel antisense compound targeted to a nucleic  
 CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
 CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a  
 CC phosphorothioate backbone throughout and in which all cytidine residues  
 CC are 5-methylcytidines.

PS Claim 1; SEQ ID NO 669; 405pp; English.
XX
CC The invention relates to a novel antisense compound targeted to a nucleic
CC acid molecule encoding human apolipoprotein B (ApoB) which specifically
CC hybridises with and inhibits the expression of human apolipoprotein B.
CC The compound of the invention demonstrates antiarteriosclerotic,
CC cardiant, antidiabetic and anorectic activities and may be useful for
CC preparing a composition for treating abnormal lipid or cholesterol
CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or
CC cardiovascular disease. Furthermore, the compound has gene therapy
CC applications. The current sequence is that of the human ApoB antisense
CC inhibition target DNA of the invention.

XX PD New antisense compound, useful for preparing a composition for treating
XX PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes type
XX PT 2, obesity, hyperlipidaemia or cardiovascular disease.
XX PS Claim 1; SEQ ID NO 559; 405pp; English.
XX XX
XX CC The invention relates to a novel antisense compound targeted to a nucleic
XX CC acid molecule encoding human apolipoprotein B (ApoB) which specifically
XX CC hybridises with and inhibits the expression of human apolipoprotein B.
XX CC The compound of the invention demonstrates antiarteriosclerotic,
XX CC cardiant, antidiabetic and anorectic activities and may be useful for
XX CC preparing a composition for treating abnormal lipid or cholesterol
XX CC metabolism, atherosclerosis, diabetes type 2, obesity, hyperlipidaemia or
XX CC cardiovascular disease. Furthermore, the compound has gene therapy
XX CC applications. The current sequence is that of the human ApoB antisense
XX CC inhibition target DNA of the invention.

XX New antisense compound, useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease.

XX Claim 1; SEQ ID NO 205; 405pp; English.

XX The invention relates to a novel antisense compound targeted to a nucleic acid molecule encoding human apolipoprotein B (ApoB) which specifically hybridises with and inhibits the expression of human apolipoprotein B.

CC The compound of the invention demonstrates antiarteriosclerotic, cardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease. Furthermore, the compound has gene therapy applications. The current sequence is that of the 2'-O-methoxyethyl (2'-MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a phosphorothioate backbone throughout and in which all cytidine residues are 5-methylcytidines.

PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type
PT 2, obesity, hyperlipidemia or cardiovascular disease.
XX
XX Claim 1; SEQ ID NO 562; 405pp; English.
XX
XX The invention relates to a novel antisense compound targeted to a nucleic
CC acid molecule encoding human apolipoprotein B (ApoB) which specifically
CC hybridises with and inhibits the expression of human apolipoprotein B.
CC The compound of the invention demonstrates antiarteriosclerotic,
CC cardiant, antidiabetic and anorectic activities and may be useful for
CC preparing a composition for treating abnormal lipid or cholesterol
CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or
CC cardiovascular disease. Furthermore, the compound has gene therapy
CC applications. The current sequence is that of the human ApoB antisense
CC inhibition target DNA of the invention.

 PT abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type  
 PT 2, obesity, hyperlipidaemia or cardiovascular disease.  
 XX PS Claim 1; SEQ ID NO 200; 405pp; English.

XX The invention relates to a novel antisense compound targeted to a nucleic  
 CC acid molecule encoding human apolipoprotein B (ApoB) which specifically  
 CC hybridises with and inhibits the expression of human apolipoprotein B.  
 CC The compound of the invention demonstrates antiarteriosclerotic,  
 CC cardiant, antidiabetic and anorectic activities and may be useful for  
 CC preparing a composition for treating abnormal lipid or cholesterol  
 CC metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or  
 CC cardiovascular disease. Furthermore, the compound has gene therapy  
 CC applications. The current sequence is that of the 2'-O-methoxyethyl (2'-  
 CC MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a  
 CC phosphorothioate backbone throughout and in which all cytidine residues  
 CC are 5-methylcytidines.

XX Antisense oligonucleotide compound that inhibits expression of mRNA
PT encoding human apolipoprotein B, useful for treating hyperlipidemia,
PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
PT syndrome.
XX
XX Example 15; SEQ ID NO 31; 483pp; English.
XX
XX The invention relates to a novel antisense compound where the compound
CC hybridises to and inhibits expression of mRNA encoding human
CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
CC confluent HepG2 cells in culture at a concentration of 150 nM. The
CC compound of the invention demonstrates cardiovascular,
CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiand,
CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
CC endocrine, vasotropic, neuroprotective and norectic activities and may
CC be useful for inhibiting the expression of apolipoprotein B in cells or
CC tissues in vivo in order to address a condition associated with abnormal
CC lipid or cholesterol metabolism. The compound may be useful for
CC decreasing circulating lipoprotein levels, triglyceride levels,
CC cholesterol levels, lipid levels, fatty acid levels, acute phase
CC reactants and chylomicrons and thus may be utilised during treatment of
CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
CC cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,

XX
XX Antisense oligonucleotide compound that inhibits expression of mRNA
XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX
XX Example 30; SEQ ID NO 289; 483pp; English.
XX
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,

```

---

```

CC CC endocrine, vasotropic, neuroprotective and nootropic activities and may
CC be useful for inhibiting the expression of apolipoprotein B in cells or
CC tissues in vivo in order to address a condition associated with abnormal
CC lipid or cholesterol metabolism. The compound may be useful for
CC decreasing circulating lipoprotein levels, triglyceride levels,
CC cholesterol levels, lipid levels, fatty acid levels, acute phase
CC reactants and chylomicrons and thus may be utilised during treatment of
CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's
CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
CC impotence, obstructive liver disease, Alzheimer's disease, dementia,
CC diabetes, obesity and atherosclerosis. The current sequence is that of an
CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
CC targeted to human Apob RNA.

XX Antisense oligonucleotide compound that inhibits expression of mRNA  
 encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.

PS Example 29; SEQ ID NO 199; 483pp; English.

XX The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cyostatic,  
 CC endocrine, vasotropic, neuroprotective and neurotropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension, uraemia,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human ApoB RNA.

 XX  
 CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of a  
 CC human apolipoprotein B (ApoB) antisense therapy target DNA of the

CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

XX
XX  Antisense oligonucleotide compound that inhibits expression of mRNA
XX  encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX  diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX  syndrome.
XX
XX  Example 15; SEQ ID NO 35; 483pp; English.
XX
XX  The invention relates to a novel antisense compound where the compound
XX  hybridises to and inhibits expression of mRNA encoding human
XX  apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX  confluent HepG2 cells in culture at a concentration of 150 nM. The
XX  compound of the invention demonstrates cardiovascular.
XX  antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiac,
XX  vasotrophic, hypotensive, anabolic, eating disorder-related, cyostatic,
XX  endocrine, vasotrophic, neuroprotective and nootropic activities and may
XX  be useful for inhibiting the expression of apolipoprotein B in cells or
XX  tissues in vivo in order to address a condition associated with abnormal
XX  lipid or cholesterol metabolism. The compound may be useful for
XX  decreasing circulating lipoprotein levels, triglyceride levels,
XX  cholesterol levels, lipid levels, fatty acid levels, acute phase
XX  reactants and chylomicrons and thus may be utilised during treatment of
XX  hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX  cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
XX  syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX  anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX  impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX  diabetes, obesity and atherosclerosis. The current sequence is that of an

 XX Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX  
 PS Example 29; SEQ ID NO 253; 483bp; English.  
 CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipidemic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, vasotropic, neuroprotective and neurotropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia, an  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human ApoB RNA.

 PT Antisense oligonucleotide compound that inhibits expression of mRNA  
 encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX  
 PS Example 60; SEQ ID NO 879; 483pp; English.  
 XX  
 CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase

CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of a  
 CC phosphodiester double-stranded RNA of the invention which is targeted to  
 CC human ApoB RNA.

XX
XX Antisense oligonucleotide compound that inhibits expression of mRNA
XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX
XX Example 29; SEQ ID NO 200; 483pp; English.
XX
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antilipidaemic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX endocrine, vasotropic, neuroprotective and neurotropic activities and may
XX be useful for inhibiting the expression of apolipoprotein B in cells or
XX tissues in vivo in order to address a condition associated with abnormal
XX lipid or cholesterol metabolism. The compound may be useful for
XX decreasing circulating lipoprotein levels, triglyceride levels,
XX cholesterol levels, lipid levels, fatty acid levels, acute phase
XX reactants and chylomicrons and thus may be utilised during treatment of
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's
XX syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX diabetes, obesity and atherosclerosis. The current sequence is that of an
XX antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX targeted to human ApoB RNA.

XX Antisense oligonucleotide compound that inhibits expression of mRNA encoding human apolipoprotein B, useful for treating hyperlipidemia, diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's syndrome.

XX Example 60; Page 218; 483pp; English.

XX The invention relates to a novel antisense compound where the compound hybridises to and inhibits expression of mRNA encoding human apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80% confluent Hep2 cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, antiarteriosclerotic, antilipidemic, antidiabetic, anorectic, cardiatic, vasotropic, hypotensive, anabolic, eating disorder-related, cytotstatic, endocrine, vasotropic, neuroprotective and nootropic activities and may be useful for inhibiting the expression of apolipoprotein B in cells or tissues in vivo in order to address a condition associated with abnormal lipid or cholesterol metabolism. The compound may be useful for decreasing circulating lipoprotein levels, triglyceride levels, cholesterol levels, lipid levels, fatty acid levels, acute phase reactants and chylomicrons and thus may be utilised during treatment of hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension, anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia, impotence, obstructive liver disease, Alzheimer's disease, dementia, diabetes, obesity and atherosclerosis. The current sequence is that of a phosphodiester double-stranded RNA of the invention which is targeted to human ApoB RNA. This sequence is assigned a SEQ ID NO but does match that given in the sequence listing.

XX      WPI; 2004-420321/39.
XX
XX      Antisense oligonucleotide compound that inhibits expression of mRNA
XX      encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX      diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX      syndrome.
XX
XX      Example 29; SEQ ID NO 189; 483pp; English.
XX
XX      The invention relates to a novel antisense compound where the compound
XX      hybridises to and inhibits expression of mRNA encoding human
XX      apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX      confluent HepG2 cells in culture at a concentration of 150 nM. The
XX      compound of the invention demonstrates cardiovascular,
XX      antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,
XX      vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX      endocrine, vasotropic, neuroprotective and neurotropic activities and may
XX      be useful for inhibiting the expression of apolipoprotein B in cells or
XX      tissues in vivo in order to address a condition associated with abnormal
XX      lipid or cholesterol metabolism. The compound may be useful for
XX      decreasing circulating lipoprotein levels, triglyceride levels,
XX      cholesterol levels, lipid levels, fatty acid levels, acute phase
XX      reactants and chylomicrons and thus may be utilised during treatment of
XX      hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX      cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
XX      syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX      anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX      impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX      diabetes, obesity and atherosclerosis. The current sequence is that of an
XX      antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX      targeted to human ApoB RNA.

XX
XX Antisense oligonucleotide compound that inhibits expression of mRNA
XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX
XX Example 29; SEQ ID NO 250; 483pp; English.
XX
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX endocrine, vasotropic, neuroprotective and neurotropic activities and may
XX be useful for inhibiting the expression of apolipoprotein B in cells or
XX tissues in vivo in order to address a condition associated with abnormal
XX lipid or cholesterol metabolism. The compound may be useful for
XX decreasing circulating lipoprotein levels, triglyceride levels,
XX cholesterol levels, lipid levels, fatty acid levels, acute phase
XX reactants and chylomicrons and thus may be utilised during treatment of
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
XX syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX diabetes, obesity and atherosclerosis. The current sequence is that of an
XX antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX targeted to human ApoB RNA.

XX Antisense oligonucleotide compound that inhibits expression of mRNA encoding human apolipoprotein B, useful for treating hyperlipidemia, diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's syndrome.

PS Example 36; SEQ ID NO 586; 483pp; English.  
XX The invention relates to a novel antisense compound where the compound hybridises to and inhibits expression of mRNA encoding human apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80% confluent HepG2 cells in culture at a concentration of 150 nM. The compound of the invention demonstrates cardiovascular, antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant, vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic, endocrine, vasotropic, neuroprotective and nootropic activities and may be useful for inhibiting the expression of apolipoprotein B in cells or tissues in vivo in order to address a condition associated with abnormal lipid or cholesterol metabolism. The compound may be useful for decreasing circulating lipoprotein levels, triglyceride levels, cholesterol levels, lipid levels, fatty acid levels, acute phase reactants and chylomicrons and thus may be utilised during treatment of hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension, anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia, impotence, obstructive liver disease, Alzheimer's disease, dementia, diabetes, obesity and atherosclerosis. The current sequence is that of a human apolipoprotein B (ApoB) antisense therapy target DNA of the invention. The human ApoB gene is located at chromosome 2p23-2p24.

XX CC The invention relates to a novel antisense compound where the compound

CC hybridises to and inhibits expression of mRNA encoding human

CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%

CC confluent HepG2 cells in culture at a concentration of 150 nM. The

CC compound of the invention demonstrates cardiovascular,

CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiac,

CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,

CC endocrine, vasotropic, neuroprotective and neurotropic activities and may

CC be useful for inhibiting the expression of apolipoprotein B in cells or

CC tissues in vivo in order to address a condition associated with abnormal

CC lipid or cholesterol metabolism. The compound may be useful for

CC decreasing circulating lipoprotein levels, triglyceride levels,

CC cholesterol levels, lipid levels, fatty acid levels, acute phase

CC reactants and chylomicrons and thus may be utilised during treatment of

CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,

CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's

CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,

CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,

CC impotence, obstructive liver disease, Alzheimer's disease, dementia,

CC diabetes, obesity and atherosclerosis. The current sequence is that of an

CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is

CC targeted to human ApoB RNA.

PI Crooke R, Graham M, Lemonidis-Tarbet K, Dobie KW;
XX WPI; 2004-420321/39.
XX Antisense oligonucleotide compound that inhibits expression of mRNA
XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX Example 36; SEQ ID NO 553; 483bp; English.
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiac,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX endocrine, vasotropic, neuroprotective and neurotropic activities and may
XX be useful for inhibiting the expression of apolipoprotein B in cells or
XX tissues in vivo in order to address a condition associated with abnormal
XX lipid or cholesterol metabolism. The compound may be useful for
XX decreasing circulating lipoprotein levels, triglyceride levels,
XX cholesterol levels, lipid levels, fatty acid levels, acute phase
XX reactants and chylomicrons and thus may be utilised during treatment of
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX diabetes, obesity and atherosclerosis. The current sequence is that of a
XX human apolipoprotein B (ApoB) antisense therapy target DNA of the
XX invention. The human ApoB gene is located at chromosome 2p23-2p24.

XX Antisense oligonucleotide compound that inhibits expression of mRNA
XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX Example 29; SEQ ID NO 130; 483pp; English.
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antilipidaemic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX endocrine, vasotropic, neuroprotective and nootropic activities and may
XX be useful for inhibiting the expression of apolipoprotein B in cells or
XX tissues in vivo in order to address a condition associated with abnormal
XX lipid or cholesterol metabolism. The compound may be useful for
XX decreasing circulating lipoprotein levels, triglyceride levels,
XX cholesterol levels, lipid levels, fatty acid levels, acute phase
XX reactants and chylomicrons and thus may be utilised during treatment of
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's
XX syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX diabetes, obesity and atherosclerosis. The current sequence is that of an
XX antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX targeted to human ApoB RNA.

 XX Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 PT  
 XX Example 35; SEQ ID NO 514; 483pp; English.  
 PS  
 XX The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipaemic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human ApoB RNA.

XX Antisense oligonucleotide compound that inhibits expression of mRNA
XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX Example 60; Page 218; 483pp; English.
XX
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular,
XX antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX endocrine, vasotropic, neuroprotective and neurotropic activities and may
XX be useful for inhibiting the expression of apolipoprotein B in cells or
XX tissues in vivo in order to address a condition associated with abnormal
XX lipid or cholesterol metabolism. The compound may be useful for
XX decreasing circulating lipoprotein levels, triglyceride levels,
XX cholesterol levels, lipid levels, fatty acid levels, acute phase
XX reactants and chylomicrons and thus may be utilised during treatment of
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's
XX syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX diabetes, obesity and atherosclerosis. The current sequence is that of a
XX phosphodiester double-stranded RNA of the invention which is targeted to
XX human ApoB RNA. This sequence is assigned a SEQ ID NO but does match that
XX given in the sequence listing.

DR Antisense oligonucleotide compound that inhibits expression of mRNA  
PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
PT syndrome.  
XX  
PS Example 15; SEQ ID NO 17; 483pp; English.  
XX  
XX The invention relates to a novel antisense compound where the compound  
CC hybridises to and inhibits expression of mRNA encoding human  
CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
CC compound of the invention demonstrates cardiovascular,  
CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,  
CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
CC be useful for inhibiting the expression of apolipoprotein B in cells or  
CC tissues in vivo in order to address a condition associated with abnormal  
CC lipid or cholesterol metabolism. The compound may be useful for  
CC decreasing circulating lipoprotein levels, triglyceride levels,  
CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
CC reactants and chylomicrons and thus may be utilised during treatment of  
CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
CC targeted to human ApoB RNA.

 XX Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX  
 XX Example 29; SEQ ID NO 218; 483pp; English.  
 XX  
 XX The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human ApoB RNA.

 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX PS Example 36; SEQ ID NO 584; 483pp; English.  
 XX CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of a  
 CC human apolipoprotein B (ApoB) antisense therapy target DNA of the  
 CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

 DR Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX Example 29; SEQ ID NO 137; 483pp; English.  
 XX The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipidaemic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cyostatic,  
 CC endocrine, vasotropic, neuroprotective and nootropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human ApoB RNA.

XX      WPI; 2004-420321/39.
XX
XX      Antisense oligonucleotide compound that inhibits expression of mRNA
XX      encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX      diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX      syndrome.
XX
XX      Example 15; SEQ ID NO 32; 483pp; English.
XX
XX      The invention relates to a novel antisense compound where the compound
XX      hybridises to and inhibits expression of mRNA encoding human
XX      apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX      confluent HepG2 cells in culture at a concentration of 150 nM. The
XX      compound of the invention demonstrates cardiovascular,
XX      antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,
XX      vasotrophic, hypotensive, anabolic, eating disorder-related, cyrostatic,
XX      endocrine, vasotropic, neuroprotective and nototropic activities and may
XX      be useful for inhibiting the expression of apolipoprotein B in cells or
XX      tissues in vivo in order to address a condition associated with abnormal
XX      lipid or cholesterol metabolism. The compound may be useful for
XX      decreasing circulating lipoprotein levels, triglyceride levels,
XX      reactants and chylomicrons and thus may be utilised during treatment of
XX      hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX      cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
XX      syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX      anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX      impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX      diabetes, obesity and atherosclerosis. The current sequence is that of an
XX      antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX      targeted to human ApoB RNA.

XX PS Antisense oligonucleotide compound that inhibits expression of mRNA
XX CC encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX CC diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX CC syndrome.
XX PS Example 36; SEQ ID NO 623; 483pp; English.
XX CC The invention relates to a novel antisense compound where the compound
XX CC hybridises to and inhibits expression of mRNA encoding human
XX CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX CC confluent HepG2 cells in culture at a concentration of 150 nM. The
XX CC compound of the invention demonstrates cardiovascular,
XX CC antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,
XX CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,
XX CC endocrine, vasotropic, neuroprotective and nootropic activities and may
XX CC be useful for inhibiting the expression of apolipoprotein B in cells or
XX CC tissues in vivo in order to address a condition associated with abnormal
XX CC lipid or cholesterol metabolism. The compound may be useful for
XX CC decreasing circulating lipoprotein levels, triglyceride levels,
XX CC cholesterol levels, lipid levels, fatty acid levels, acute phase
XX CC reactants and chylomicrons and thus may be utilised during treatment of
XX CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,
XX CC cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
XX CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX CC impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX CC diabetes, obesity and atherosclerosis. The current sequence is that of a
XX CC human apolipoprotein B (ApoB) antisense therapy target DNA of the
XX CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

PT Antisense oligonucleotide compound that inhibits expression of mRNA  
PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
PT syndrome.  
XX  
PS Example 29; SEQ ID NO 193; 483pp; English.  
XX  
XX The invention relates to a novel antisense compound where the compound  
XX hybridises to and inhibits expression of mRNA encoding human  
XX apolipoprotein B (Apob) after 16-24 hours by at least 30% in 80%  
XX confluent HepG2 cells in culture at a concentration of 150 nM. The  
XX compound of the invention demonstrates cardiovascular,  
XX antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,  
XX vasotrophic, hypotensive, anabolic, eating disorder-related, cytostatic,  
XX endocrine, vasotrophic, neuroprotective and nootropic activities and may  
XX be useful for inhibiting the expression of apolipoprotein B in cells or  
XX tissues in vivo in order to address a condition associated with abnormal  
XX lipid or cholesterol metabolism. The compound may be useful for  
XX decreasing circulating lipoprotein levels, triglyceride levels,  
XX cholesterol levels, lipid levels, fatty acid levels, acute phase  
XX reactants and chylomicrons and thus may be utilised during treatment of  
XX hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
XX cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's

CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
CC targeted to human Apob RNA.

XX encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX syndrome.
XX
XX Example 36; SEQ ID NO 561; 483pp; English.
XX
XX The invention relates to a novel antisense compound where the compound
XX hybridises to and inhibits expression of mRNA encoding human
XX apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%
XX confluent HepG2 cells in culture at a concentration of 150 nM. The
XX compound of the invention demonstrates cardiovascular.
XX antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,
XX vasotropic, hypotensive, anabolic, eating disorder-related, cycostatic,

```

CC endocrine, vasotropic, neuroprotective and neurotropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of a  
 CC human apolipoprotein B (ApoB) antisense therapy target DNA of the  
 CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

PT Antisense oligonucleotide compound that inhibits expression of mRNA  
 PT encoding human apolipoprotein B, useful for treating hyperlipidemia,  
 PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's  
 PT syndrome.  
 XX  
 XX Example 29; SEQ ID NO 201; 483pp; English.  
 PS  
 PS The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent HepG2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytosclatic,  
 CC endocrine, vasotropic, neuroprotective and neurotropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia,  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of an  
 CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is  
 CC targeted to human ApoB RNA.

 PS Example 36; SEQ ID NO 654; 483pp; English.  
 XX

CC The invention relates to a novel antisense compound where the compound  
 CC hybridises to and inhibits expression of mRNA encoding human  
 CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%  
 CC confluent Hep2 cells in culture at a concentration of 150 nM. The  
 CC compound of the invention demonstrates cardiovascular,  
 CC antiarteriosclerotic, antilipaeamic, antidiabetic, anorectic, cardiant,  
 CC vasotropic, hypotensive, anabolic, eating disorder-related, cytostatic,  
 CC endocrine, neuroprotective and neurotropic activities and may  
 CC be useful for inhibiting the expression of apolipoprotein B in cells or  
 CC tissues in vivo in order to address a condition associated with abnormal  
 CC lipid or cholesterol metabolism. The compound may be useful for  
 CC decreasing circulating lipoprotein levels, triglyceride levels,  
 CC cholesterol levels, lipid levels, fatty acid levels, acute phase  
 CC reactants and chylomicrons and thus may be utilised during treatment of  
 CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, Cushing's  
 CC cardiovascular disorders, Von Gierke's disease, lipodystrophy, Cushing's  
 CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,  
 CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,  
 CC impotence, obstructive liver disease, Alzheimer's disease, dementia,  
 CC diabetes, obesity and atherosclerosis. The current sequence is that of a  
 CC human apolipoprotein B (ApoB) antisense therapy target DNA of the  
 CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

PS The invention relates to a novel antisense compound where the compound

XX hybridises to and inhibits expression of mRNA encoding human

CC apolipoprotein B (ApoB) after 16-24 hours by at least 30% in 80%

CC confluent HepG2 cells in culture at a concentration of 150 nM. The

CC compound of the invention demonstrates cardiovascular,

CC antiarteriosclerotic, antilipidemic, antidiabetic, anorectic, cardiant,

CC vasotropic, hypotensive, anabolic, eating disorder-related, cyostatic,

CC endocrine, vasotropic, neuroprotective and nootropic activities and may

CC be useful for inhibiting the expression of apolipoprotein B in cells or

CC tissues in vivo in order to address a condition associated with abnormal

CC lipid or cholesterol metabolism. The compound may be useful for

CC decreasing circulating lipoprotein levels, triglyceride levels,

CC cholesterol levels, lipid levels, fatty acid levels, acute phase

CC reactants and chylomicrons and thus may be utilised during treatment of

CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, and

CC cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's

CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,

CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,

CC impotence, obstructive liver disease, Alzheimer's disease, dementia,

CC diabetes, obesity and atherosclerosis. The current sequence is that of a

CC human apolipoprotein B (ApoB) antisense therapy target DNA of the

CC invention. The human ApoB gene is located at chromosome 2p23-2p24.

 XX  
 PS Example 1; Page 10; 24pp; French.

A series of primers (AAQ72756-64) used in the novel process solid phase restriction enzymatic amplification (SPREA). The method is based on the type II restriction enzymes (RE), especially those that cleave outside their recognition sequence e.g. BsaI. The process involves binding a primer containing one strand of the RE cleavage site, and extending no further than the RE cleavage site, to a solid support e.g. the walls of a microtiter plate well. A second primer with a region complementary to the first primer hybridises to the first primer and extends as a single strand from the cleavage site to the RE recognition site. The extension region of the second primer, in one case, includes a region complementary to the target and, for the other primer, a single strand region which will bind the sequence complementary to the target sequence. One of the single-stranded regions has a 5' end, the other a 3' end. DNA from the sample to be detected e.g. whole cell extract DNA, is added to the well such that the target DNA and the first primer hybridise and regenerate the RE-cleavage site. The RE cleaves the site and releases the target sequence and its complement which can then hybridise to the second probe. The second round of cleavage results in both strands, equivalent to the target sequence, being amplified. Detection of the product is performed by hybridisation of probes (e.g. AAQ72761-2) linked to an enzyme e.g. horseradish peroxidase or alkaline phosphatase. The method provides a rapid and sensitive detection of target sequences without the use of

CC radioisotopes. The target sequence to be detected can be determined by  
 CC the sequence of the bound primers and the type II RE involved. This  
 CC system allows the detection and/or quantification of pathogenic  
 CC organisms, allelic variants, genomic defects, specific mRNAs etc., e.g.  
 CC for diagnosis of genetic diseases. (Updated on 25-MAR-2003 to correct PN  
 CC field.)

 CC PCR primers AAH28141-42 were used to amplify a partial cDNA sequence of  
 CC expressed sequence tag (EST) M91490. This EST is related to human  
 CC suppressive macrophage activation factor (SMAF)-1, and is referred to as  
 CC SMAF-2. SMAF-1 and SMAF-2 modulate the production of Th1, Th2 and Th3  
 CC cytokines. The specification describes the use of SMAF-1 and SMAF-2 for  
 CC the manufacture of a medicament for the treatment of diseases mediated by  
 CC type 1, type 2 or type 3 responses, such as inflammation, infections,  
 CC allergies, autoimmune diseases, transplant rejections, graft-versus host  
 CC disease, malignancies and diseases involving mucosal immunity. They are  
 CC used especially for the treatment of inflammatory bowel disease,  
 CC leishmaniasis, trypanosomiasis, malaria, schistosomiasis, HIV-associated  
 CC diseases, measles, influenza, tuberculosis, lepra, and infections by  
 CC Candida, Borrelia, Listeria, Bordetella or Chlamydia, psoriasis, multiple  
 CC sclerosis, and rheumatoid arthritis

XX PT New purified nucleic acid for producing a soybean plant having soybean
XX PT cyst nematode resistance and for use in plant breeding programs.
XX PS Claim 25; Page 1203; 1353pp; English.
XX CC The invention relates to nucleic acid molecules from regions of the
XX CC soybean genome which are associated with soybean cyst nematode (SCN)
XX CC resistance. The nucleic acids are used to transform plants, and can
XX CC produce soybean plants having an rhg1 or an Rhg4 SCN resistant allele.
XX CC The nucleic acids can be used for investigating rhg1 or Rhg4 haplotypes
XX CC of soybean plants and for introgressing SCN resistance or partial SCN
XX CC resistance into soybean plants. They can also be used in plant breeding
XX CC programmes. The invention also relates to proteins encoded by such
XX CC nucleic acid molecules, as well as antibodies capable of recognising
XX CC these proteins. The present sequence is a primer used to amplify a region
XX CC of the soybean genome

XX PT Antisense oligonucleotide compound that inhibits expression of mRNA
XX PT encoding human apolipoprotein B, useful for treating hyperlipidemia,
XX PT diabetes, obesity, von Gierke's disease, lipodystrophies, Cushing's
XX PT syndrome.
XX PS Example 59; SEQ ID NO 871; 483pp; English.
XX CC The invention relates to a novel antisense compound where the compound
XX CC hybridises to and inhibits expression of mRNA encoding human
XX CC apolipoprotein B (Apob) after 16-24 hours by at least 30% in 80%
XX CC confluent HepG2 cells in culture at a concentration of 150 nM. The
XX CC compound of the invention demonstrates cardiovascular,
XX CC antiarteriosclerotic, antilipemic, antidiabetic, anorectic, cardiant,
XX CC vasotrophic, hypotensive, anabolic, eating disorder-related, cycostatic,
XX CC endocrine, vasotropic, neuroprotective and nootropic activities and may
XX CC be useful for inhibiting the expression of apolipoprotein B in cells or
XX CC tissues in vivo in order to address a condition associated with abnormal
XX CC lipid or cholesterol metabolism. The compound may be useful for
XX CC decreasing circulating lipoprotein levels, triglyceride levels,
XX CC cholesterol levels, lipid levels, fatty acid levels, acute phase
XX CC reactants and chylomicrons and thus may be utilised during treatment of
XX CC hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, Cushing's
XX CC cardiovascular disorders, von Gierke's disease, lipodystrophy, Cushing's
XX CC syndrome, sexual ateliotic dwarfism, hyperthyroidism, hypertension,
XX CC anorexia nervosa, Werner's syndrome, hepatoma, multiple myeloma, uraemia,
XX CC impotence, obstructive liver disease, Alzheimer's disease, dementia,
XX CC diabetes, obesity and atherosclerosis. The current sequence is that of an
XX CC antisense 2'-MOE (2'-methoxyethyl) gapmer oligo of the invention which is
XX CC targeted to human Apob RNA.

 PI WPI; 2004-677362/66.  
 DR Interference RNA agent useful for treating dyslipidemias, coronary artery  
 XX disease, diabetes, cancer or neurological disease, comprises sense  
 XX sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 45; 378pp; English.  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 52; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

CC can be used to control ApoB gene expression.

XX DR Interference RNA agent useful for treating dyslipidemias, coronary artery  
XX PT disease, diabetes, cancer or neurological disease, comprises sense  
XX PT sequence and antisense sequence which has specific modifications.  
XX PS Example 5; SEQ ID NO 214; 378pp; English.  
XX CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
XX CC sense sequence and an antisense sequence, where the sense sequences have  
XX CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
XX CC sequences have one or more asymmetrical phosphorothioate modifications  
XX CC and the antisense sequence targets a human gene sequence. Also described  
XX CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
XX CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
XX CC stabilising (I), involves selecting a sequence with activity and  
XX CC introducing one or more asymmetrical modification in the sequence, where  
XX CC the modification decreases nuclease sensitivity while not decreasing its  
XX CC activity; a kit comprising (I) and instruction for its use; and a device  
XX CC that can be dispense or administer a composition comprising (I). (I) is  
XX CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
XX CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
XX CC The subject is suffering from a disorder characterised by elevated or  
XX CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
XX CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
XX CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
XX CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
XX CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
XX CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
XX CC inhibit hepatic glucose production or for treating glucose-metabolism-  
XX CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
XX CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
XX CC lung cancer), neurological disease (e.g., Huntington disease or  
XX CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
XX CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
XX CC can be used to control ApoB gene expression.  
XX Sequence 19 BP; 6 A; 7 C; 3 G; 3 T; 0 U; 0 Other;

 PA Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 394; 378pp; English.  
 PS The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 505; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nucleic acid sensitivity while not decreasing its activity; a kit comprising (I) and instructions for its use; and a device that can be dispensed or administered a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

XX  
 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

XX  
 XX Example 5; SEQ ID NO 509; 378pp; English.

CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity, a kit comprising (I) and instruction for its use, and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 756; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
XX is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX dyslipidaemias, hypercholesterolaemia, statin-resistant
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX lung cancer), neurological disease (e.g., Huntington disease or
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 815; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where

```

---

```

the modification decreases nuclease sensitivity while not decreasing its
activity; a kit comprising (I) and instruction for its use; and a device
that can be dispense or administer a composition comprising (I). (I) is
useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
The subject is suffering from a disorder characterised by elevated or
otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
levels of cholesterol, and/or dysregulation of lipid metabolism. The
disorder is chosen from the HDL/LDL cholesterol imbalance,
dyslipidaemias, hypercholesterolaemia, statin-resistant
hypercholesterolaemia, coronary artery disease (CAD), coronary heart
disease (CHD) and atherosclerosis. (I) is administered to a subject to
inhibit hepatic glucose production or for treating glucose-metabolism-
related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
treating the diseases as mentioned above, cancer (e.g. breast, colon or
lung cancer), neurological disease (e.g., Huntington disease or
spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
can be used to control ApoB gene expression.

 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 880; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

CC and the antisense sequence targets a human gene sequence. Also described

CC are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100

CC levels or glucose-6-phosphatase levels in a subject; producing (I);

CC stabilising (I), involves selecting a sequence with activity and

CC introducing one or more asymmetrical modification in the sequence, where

CC the modification decreases nuclease sensitivity while not decreasing its

CC activity; a kit comprising (I) and instruction for its use; and a device

CC that can be dispense or administer a composition comprising (I). (I) is

CC useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)

CC is useful for reducing apob-100 levels or glucose-6-phosphatase levels. (M1)

CC The subject is suffering from a disorder characterised by elevated or

CC otherwise unwanted expression of apob-100, elevated or otherwise unwanted

CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

CC disorder is chosen from the HDL/LDL cholesterol imbalance,

CC dyslipidaemias, hypercholesterolaemia, statin-resistant

CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart

CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

CC inhibit hepatic glucose production or for treating glucose-metabolism-

CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for

CC treating the diseases as mentioned above, cancer (e.g. breast, colon or

CC lung cancer), neurological disease (e.g., Huntington disease or

CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that

CC can be used to control ApoB gene expression.

XX Example 5; SEQ ID NO 1264; 378pp; English.  
XX  
XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
XX sense sequence and an antisense sequence, where the sense sequences have  
XX one or more asymmetrical 2'-O alkyl modifications, the antisense  
XX sequences have one or more asymmetrical phosphorothioate modifications  
XX and the antisense sequence targets a human gene sequence. Also described  
XX are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
XX levels or glucose-6-phosphatase levels in a subject; producing (I);  
XX stabilising (I), involves selecting a sequence with activity and  
XX introducing one or more asymmetrical modification in the sequence, where  
XX the modification decreases nuclease sensitivity while not decreasing its  
XX activity; a kit comprising (I) and instruction for its use; and a device  
XX that can be dispense or administer a composition comprising (I). (I) is  
XX useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
XX The subject is suffering from a disorder characterised by elevated or  
XX otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The  
XX disorder is chosen from the HDL/LDL cholesterol imbalance,  
XX dyslipidaemias, hypercholesterolaemia, statin-resistant  
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to  
XX inhibit hepatic glucose production or for treating glucose-metabolism-  
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or  
XX lung cancer), neurological disease (e.g., Huntington disease or  
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
XX can be used to control ApoB gene expression.

CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 1369; 378pp; English.

CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX (ALNY-) ALNYLAM PHARM.  
 XX Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 DR  
 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 XX disease, diabetes, cancer or neurological disease, comprises sense  
 XX sequence and antisense sequence which has specific modifications.  
 PS Example 5; SEQ ID NO 1808; 378pp; English.  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
XX disease, diabetes, cancer or neurological disease, comprises sense  
XX sequence and antisense sequence which has specific modifications.  
XX Example 5; SEQ ID NO 2027; 378pp; English.  
XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
XX sense sequence and an antisense sequence, where the sense sequences have  
XX one or more asymmetrical 2'-O alkyl modifications, the antisense  
XX sequences have one or more asymmetrical phosphorothioate modifications  
XX and the antisense sequence targets a human gene sequence. Also described  
XX are: a pharmaceutical preparation comprising (I); reducing (M) apoB-100  
XX levels or glucose-6-phosphatase levels in a subject; producing (I);  
XX stabilising (I), involves selecting a sequence with activity and  
XX introducing one or more asymmetrical modification in the sequence, where  
XX the modification decreases nuclease sensitivity while not decreasing its  
XX activity; a kit comprising (I) and instruction for its use; and a device  
XX that can be dispense or administer a composition comprising (I). (I) is  
XX useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M)  
XX is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
XX The subject is suffering from a disorder characterised by elevated or  
XX otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The  
XX disorder is chosen from the HDL/LDL cholesterol imbalance,  
XX dyslipidaemias, hypercholesterolaemia, statin-resistant  
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to  
XX inhibit hepatic glucose production or for treating glucose-metabolism-  
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or  
XX lung cancer), neurological disease (e.g., Huntington disease or  
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 2034; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

XX CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

PT disease, diabetes, cancer or neurological disease, comprises sense

PT sequence and antisense sequence which has specific modifications.

XX Example 5; SEQ ID NO 2662; 378pp; English.

PS The invention describes a RNA interference (iRNA) agent (I) comprising a

XX sense sequence and an antisense sequence, where the sense sequences have

CC one or more asymmetrical 2'-O alkyl modifications, the antisense

CC

CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 XX Example 5; SEQ ID NO 2672; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (RNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Example 5; SEQ ID NO 2774; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control ApoB gene expression.

(ALNY-) ALNYLAM PHARM.

Manoharan M, Bumcrot D;  
WPI; 2004-677362/66.

Interference RNA agent useful for treating dyslipidemias, coronary artery  
disease, diabetes, cancer or neurological disease, comprises sense  
sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 2809; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a  
sense sequence and an antisense sequence, where the sense sequences have  
one or more asymmetrical 2'-O alkyl modifications, the antisense  
sequences have one or more asymmetrical phosphorothioate modifications  
and the antisense sequence targets a human gene sequence. Also described  
are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
levels or glucose-6-phosphate levels in a subject; producing (I);  
stabilising (I), involves selecting a sequence with activity and  
introducing one or more asymmetrical modification in the sequence, where  
the modification decreases nuclease sensitivity while not decreasing its  
activity; a kit comprising (I) and instruction for its use; and a device  
that can be dispense or administer a composition comprising (I). (I) is  
useful for reducing apoB-100 levels or glucose-6-phosphate levels. (MI)  
is useful for reducing apoB-100 levels or glucose-6-phosphate levels.  
The subject is suffering from a disorder characterised by elevated or  
otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
levels of cholesterol, and/or dysregulation of lipid metabolism. The  
disorder is chosen from the HDL/LDL cholesterol imbalance,  
dyslipidemias, hypercholesterolaemia, statin-resistant  
hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
disease (CHD) and atherosclerosis. (I) is administered to a subject to  
inhibit hepatic glucose production or for treating glucose-metabolism-  
related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
treating the diseases as mentioned above, cancer (e.g. breast, colon or  
lung cancer), neurological disease (e.g., Huntington disease or  
spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
can be used to control ApoB gene expression.

 PT Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 2818; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance, the  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant

 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 3088; 378bp; English.

XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

Interference RNA agent useful for treating dyslipidemias, coronary artery

disease, diabetes, cancer or neurological disease, comprises sense

sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 3355; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a

sense sequence and an antisense sequence, where the sense sequences have

one or more asymmetrical 2'-O alkyl modifications, the antisense

sequences have one or more asymmetrical phosphorothioate modifications

and the antisense sequence targets a human gene sequence. Also described

are: a pharmaceutical preparation comprising (I); reducing (M1) apob-100

levels or glucose-6-phosphatase levels in a subject; producing (I);

stabilising (I), involves selecting a sequence with activity and

introducing one or more asymmetrical modification in the sequence, where

the modification decreases nucleic acid sensitivity while not decreasing its

activity; a kit comprising (I) and instruction for its use; and a device

that can be dispense or administer a composition comprising (I). (I) is

that can be dispense or administer a composition comprising (I). (I) is

useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 The subject is suffering from a disorder characterised by elevated or  
 otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 disorder is chosen from the HDL/LDL cholesterol imbalance,  
 dyslipidaemias, hypercholesterolaemia, statin-resistant  
 hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 inhibit hepatic glucose production or for treating glucose-metabolism-  
 related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 lung cancer), neurological disease (e.g., Huntington disease or  
 spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 can be used to control ApoB gene expression.

 XX (ALNY-) ALNYLAM PHARM.

XX Manoharan M, Bumcrot D;  
 PI WPI; 2004-677362/66.  
 XX  
 DR Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 3363; 378pp; English.  
 PS  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance, statin-resistant  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 3602; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

PT sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 4154; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
CC sense sequence and an antisense sequence, where the sense sequences have
CC one or more asymmetrical 2'-O alkyl modifications, the antisense
CC sequences have one or more asymmetrical phosphorothioate modifications
CC and the antisense sequence targets a human gene sequence. Also described
CC are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
CC levels or glucose-6-phosphatase levels in a subject; producing (I);
CC stabilising (I), involves selecting a sequence with activity and
CC introducing one or more asymmetrical modification in the sequence, where
CC the modification decreases nuclease sensitivity while not decreasing its
CC activity; a kit comprising (I) and instruction for its use; and a device
CC that can be dispense or administer a composition comprising (I). (I) is
CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
CC The subject is suffering from a disorder characterised by elevated or
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The
CC disorder is chosen from the HDL/LDL cholesterol imbalance,
CC dyslipidaemias, hypercholesterolaemia, statin-resistant
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to
CC inhibit hepatic glucose production or for treating glucose-metabolism-
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or
CC lung cancer), neurological disease (e.g., Huntington disease or
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
CC can be used to control ApoB gene expression.

 XX  
 PS Example 5; SEQ ID NO 4366; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The

disorder is chosen from the HDL/LDL cholesterol imbalance,  
 dyslipidaemias, hypercholesterolaemia, statin-resistant  
 hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 inhibit hepatic glucose production or for treating glucose-metabolism-  
 related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 treating the diseases as mentioned above, cancer (e.g. breast colon or  
 lung cancer), neurological disease (e.g., Huntington disease or  
 spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 XX Example 5; SEQ ID NO 4870; 378pp; English.  
 XX  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to

Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.

Example 5; SEQ ID NO 20; 378pp; English.

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-O alkyl modifications, the antisense sequences have one or more asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (I); stabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels of cholesterol, and/or dysregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant hypercholesterolaemia, coronary artery disease (CAD), coronary heart disease (CHD) and atherosclerosis. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence represents a human apolipoprotein B (ApoB) antisense oligonucleotide that can be used to control ApoB gene expression.

 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX  
 PS Example 5; SEQ ID NO 37; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (MI)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

 PS Example 5; SEQ ID NO 178; 378pp; English.  
 XX  
 CC The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence

 XX (ALNY-) ALNYLAM PHARM.  
 XX Manoharan M, Bumcrot D;  
 XX WPI; 2004-677362/66.  
 XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
 PT disease, diabetes, cancer or neurological disease, comprises sense  
 PT sequence and antisense sequence which has specific modifications.  
 XX Example 5; SEQ ID NO 207; 378pp; English.  
 XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX
XX Interference RNA agent useful for treating dyslipidemias, coronary artery
XX disease, diabetes, cancer or neurological disease, comprises sense
XX sequence and antisense sequence which has specific modifications.
XX
XX Example 5; SEQ ID NO 364; 378pp; English.
XX
XX The invention describes a RNA interference (iRNA) agent (I) comprising a
XX sense sequence and an antisense sequence, where the sense sequences have
XX one or more asymmetrical 2'-O alkyl modifications, the antisense
XX sequences have one or more asymmetrical phosphorothioate modifications
XX and the antisense sequence targets a human gene sequence. Also described
XX are a pharmaceutical preparation comprising (I); reducing (M1) apoB-100
XX levels or glucose-6-phosphatase levels in a subject; producing (I);
XX stabilising (I), involves selecting a sequence with activity and
XX introducing one or more asymmetrical modification in the sequence, where
XX the modification decreases nuclease sensitivity while not decreasing its
XX activity; a kit comprising (I) and instruction for its use; and a device
XX that can be dispense or administer a composition comprising (I). (I) is
XX useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)
XX is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.
XX The subject is suffering from a disorder characterised by elevated or
XX otherwise unwanted expression of apoB-100, elevated or otherwise unwanted
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The
XX disorder is chosen from the HDL/LDL cholesterol imbalance,
XX dyslipidaemias, hypercholesterolaemia, statin-resistant
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart
XX disease (CHD) and atherosclerosis. (I) is administered to a subject to
XX inhibit hepatic glucose production or for treating glucose-metabolism-
XX related disorder e.g. diabetes or type-2 diabetes. (I) is useful for
XX treating the diseases as mentioned above, cancer (e.g. breast, colon or
XX lung cancer), neurological diseases (e.g., Huntington disease or
XX spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence
XX represents a human apolipoprotein B (ApoB) antisense oligonucleotide that
XX can be used to control ApoB gene expression.

CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

XX (ALNY-) ALNYLAM PHARM.

XX Manoharan M, Bumcrot D;

XX WPI; 2004-677362/66.

XX The invention describes a RNA interference (irRNA) agent (I) comprising a  
 CC sense sequence and an antisense sequence, where the sense sequences have  
 CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
 CC sequences have one or more asymmetrical phosphorothioate modifications  
 CC and the antisense sequence targets a human gene sequence. Also described  
 CC are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
 CC levels or glucose-6-phosphatase levels in a subject; producing (I);  
 CC stabilising (I), involves selecting a sequence with activity and  
 CC introducing one or more asymmetrical modification in the sequence, where  
 CC the modification decreases nuclease sensitivity while not decreasing its  
 CC activity; a kit comprising (I) and instruction for its use; and a device  
 CC that can be dispense or administer a composition comprising (I). (I) is  
 CC useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
 CC The subject is suffering from a disorder characterised by elevated or  
 CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
 CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
 CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
 CC dyslipidaemias, hypercholesterolaemia, statin-resistant  
 CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
 CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
 CC inhibit hepatic glucose production or for treating glucose-metabolism-  
 CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
 CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
 CC lung cancer), neurological disease (e.g., Huntington disease or  
 CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
 CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
 CC can be used to control ApoB gene expression.

CC and the antisense sequence targets a human gene sequence. Also described  
CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
CC levels or glucose-6-phosphate levels in a subject; producing (I);  
CC stabilising (I), involves selecting a sequence with activity and  
CC introducing one or more asymmetrical modification in the sequence, where  
CC the modification decreases nuclease sensitivity while not decreasing its  
CC activity, a kit comprising (I) and instruction for its use; and a device  
CC that can be dispense or administer a composition comprising (I). (I) is  
CC useful for reducing apoB-100 levels or glucose-6-phosphate levels. (MI)  
CC is useful for reducing apoB-100 levels or glucose-6-phosphate levels.  
CC The subject is suffering from a disorder characterised by elevated or  
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
CC dyslipidemias, hypercholesterolaemia, statin-resistant  
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
CC inhibit hepatic glucose production or for treating glucose-metabolism-  
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
CC lung cancer), neurological disease (e.g., Huntington disease or  
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
CC can be used to control ApoB gene expression.

XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
PT disease, diabetes, cancer or neurological disease, comprises sense  
PT sequence and antisense sequence which has specific modifications.  
XX Example 5; SEQ ID NO 430; 378pp; English.  
XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
CC sense sequence and an antisense sequence, where the sense sequences have  
CC one or more asymmetrical 2'-O alkyl modifications, the antisense  
CC sequences have one or more asymmetrical phosphorothioate modifications  
CC and the antisense sequence targets a human gene sequence. Also described  
CC are: a pharmaceutical preparation comprising (I); reducing (MI) apoB-100  
CC levels or glucose-6-phosphate levels in a subject; producing (I);  
CC stabilising (I), involves selecting a sequence with activity and  
CC introducing one or more asymmetrical modification in the sequence, where  
CC the modification decreases nuclease sensitivity while not decreasing its  
CC activity, a kit comprising (I) and instruction for its use; and a device  
CC that can be dispense or administer a composition comprising (I). (I) is  
CC useful for reducing apoB-100 levels or glucose-6-phosphate levels. (MI)  
CC is useful for reducing apoB-100 levels or glucose-6-phosphate levels.  
CC The subject is suffering from a disorder characterised by elevated or  
CC otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
CC levels of cholesterol, and/or dysregulation of lipid metabolism. The  
CC disorder is chosen from the HDL/LDL cholesterol imbalance,  
CC dyslipidemias, hypercholesterolaemia, statin-resistant  
CC hypercholesterolaemia, coronary artery disease (CAD), coronary heart  
CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
CC inhibit hepatic glucose production or for treating glucose-metabolism-  
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
CC lung cancer), neurological disease (e.g., Huntington disease or  
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
CC can be used to control ApoB gene expression.
